Marketing - Domain Knowledge & Expected Output Guide

This document defines the agency's core data framework and the exact standard we expect candidates to meet in the DA + AI Developer take-home assignment. Use this to evaluate submissions and brief candidates on context.

01
How we think
KPI tree, funnel logic, campaign structure

02
What we build
4 AI analysis modules and their outputs

03
How we judge
Exact output standard for each report

PART 1 — HOW WE THINK ABOUT PERFORMANCE MARKETING

The core objective

Everything we do as an agency is designed to automatically answer one question:

> **"What is working, what is not, and what should we do next to grow revenue?"**

The KPI tree — every account maps to this funnel

Every campaign account is structured around a single performance funnel. A healthy funnel moves users from impression to revenue. A broken funnel has a visible leak at one or more nodes. Your SQL views, Power BI pages, and AI reports must all trace this chain.

Traffic → **CTR** → **CPC** → **CVR** → **AOV** → **Revenue**

High CTR + low CVR
Landing page or offer is the problem

High ATC + low purchase
Pricing or trust is the problem

High spend + low ROAS
Creative fatigue or wrong audience

Campaign naming convention

All campaigns follow this 3-level naming structure. The candidate's SQL schema must parse these names into separate, queryable fields — not store them as a single string.

Campaign level	`Growify	TOF / MOF / BOF / Retarget	Region Name`
Ad Set level	`Walkins / Whatsapp / Ecomm / Brand Visibility	Persona Name / LAL`
Ad level	`CA/EP	Video / SI / Carousel / Flexible / Collection	CampaignShoot / Influencer / UGC / StoreVideo	Category	Collection`

- **New Campaign Structure -** Deadline -
  - **Location: Region**
    - Growify | TOF / MOF + BOF / Retarget | Region Name
      - Ad set - Walkins/Whatspp/Ecomm/Brand Visibility | Persona Name/LAL
        - Ads
          (EP: Existing post; SI : Single Image; CA : Custom Ads)
          - Catalog | SI/Video | Category | Collection
          - CA/EP | Video/SI/Carousel/Flexible/Collection | CampaignShoot | Category | Collection
          - CA/EP | Video/SI/Carousel/Flexible/Collection | Influencer | InfluencerName | Category | Collection
          - CA/EP | Video/SI/Carousel/Flexible/Collection | UGC | Category | Collection
          - CA/EP | Video/SI/Carousel/Flexible/Collection | StoreVideo | Store Location

Glossary — abbreviations used across all data and reports

Code	Meaning	Code	Meaning
TOF	**Top of Funnel** Awareness campaigns — new audiences	**ATC**	**Add to Cart** User added product to cart
MOF	**Middle of Funnel** Consideration — warm audiences	**CVR**	**Conversion Rate** Conversions ÷ Clicks
BOF	**Bottom of Funnel** Conversion — high intent audiences	**ROAS**	**Return on Ad Spend** Revenue ÷ Spend
EP	**Existing Post** Boosted organic content	**CPC**	**Cost Per Click** Spend ÷ Clicks
SI	**Single Image** Static image ad	**CTR**	**Click-Through Rate** Clicks ÷ Impressions
CA	**Custom Ads** Purpose-built ad creative	**AOV**	**Average Order Value** Revenue ÷ Orders
LAL	**Lookalike Audience** Audience similar to existing customers	**CPA**	**Cost Per Acquisition** Spend ÷ Conversions

PART 2 — THE 4 AI ANALYSIS MODULES

The AI tool (Task 4) is not a generic chatbot over a CSV. It is a structured intelligence system with four specific modules. Each module queries SQL differently, surfaces different signals, and produces a different type of output. A candidate who builds all four correctly has genuinely understood performance marketing analytics.

MODULE 1 Creative intelligence

→ Which creatives are generating the highest ROAS — by format and concept

→ Hook analysis: video hook rate vs static CTR compared by campaign

→ Fatigue detection: flag creatives where ROAS has declined >20% over 7 days

→ Best performing creative per funnel stage (TOF awareness vs BOF conversion)

MODULE 2 Audience intelligence

→ Geography breakdown: India vs US vs UAE — CPC, CVR, ROAS per region

→ Diaspora vs local audience performance comparison

→ Interest cluster performance: which segments drive lowest CPA

→ Lookalike vs interest vs retargeting — ROAS comparison

MODULE 3 **Funnel leak detection**

→ High CTR + low CVR → landing page or offer issue (flag campaigns)

→ High ATC + low purchase → pricing or trust issue (flag campaigns)

→ Channel attribution: assisted conversions via GA data

→ TOF/MOF/BOF balance check: is budget allocated proportionally to funnel performance?

MODULE 4 **Action plan (most important)**

→ Output: specific, prioritised instructions — not summaries

→ Every recommendation must be tied to a named data signal

→ Written for account managers — no jargon, no hedging

→ Must answer: what to pause, what to scale, what to fix, what to test

PART 3 — EXPECTED OUTPUT STANDARD FOR EACH REPORT

These are the four reports the AI tool must produce. Below each is the exact standard we evaluate against — and example outputs that represent a high-scoring answer. Share this section with candidates as the target benchmark.

REPORT 1 **Winners report**

Surfaces what is working so the team can double down quickly.

→ Top 3 creatives by ROAS — name, format, spend, ROAS, funnel stage

→ Top 2 audience segments by CVR — with region and interest cluster

→ Best performing region this period — with CPC, CVR, ROAS breakdown

→ Best funnel stage by efficiency — which stage is returning the most per rupee spent

EXAMPLE AI OUTPUT

"Top creative: 'Influencer_Priya_Saree_TOF' — ROAS 4.2x on ₹18,000 spend. Scale immediately."

"Best audience: Diaspora-UK interest cluster — CVR 3.1%, CPC ₹12. Increase budget by 30%."

"UAE outperforming India this week: ROAS 3.8 vs 2.1. Shift ₹10K from IN to UAE campaigns."

REPORT 2 **Losers report**

Identifies what to pause or fix before budget is wasted further.

→ Bottom 3 campaigns by ROAS — name, spend wasted, days running, ROAS
→ Dead creatives: ads running >14 days with declining CTR week-on-week
→ Highest CPA audience segments — where conversions are most expensive
→ Platforms underperforming vs agency benchmark (ROAS < 1.5)

EXAMPLE AI OUTPUT

"Pause: 'Growify|BOF|IN_Mumbai' — ₹22,000 spent, ROAS 0.8, 18 days running. No recovery trend."

"Dead creative: 'CA|Video|UGC|Kurta|Festive' — CTR dropped from 3.2% to 0.9% in 10 days. Replace."

"High CPA alert: 'Interest_HomeDecor_IN' — CPA ₹890, 3x agency benchmark. Pause or restructure."

REPORT 3 **Leakage report**

Diagnoses where users are dropping off and what is causing it.

→ Campaigns with CTR > 3% but CVR < 0.5% — likely landing page or offer mismatch
→ Campaigns with high ATC rate but low purchase rate — likely pricing or trust barrier
→ Funnel stage imbalance: over-indexed TOF with weak BOF — budget not converting
→ Region-specific leakage: where a geography has strong reach but poor conversion

EXAMPLE AI OUTPUT

"Landing issue: 'Growify|TOF|UK_London' — CTR 4.1% but CVR 0.2%. 1,200 clicks, 2 purchases. Fix the landing page."

"Pricing barrier: 'Growify|BOF|IN_Delhi' — ATC rate 8% but purchase rate 1.2%. Checkout drop-off. Test discount or EMI offer."

"Funnel gap: 78% of spend is TOF, only 8% is BOF. Retargeting pool is large but untapped. Shift 15% budget to BOF retarget."

REPORT 4 **Action plan — most important**

Specific, prioritised instructions the account manager can act on immediately. This is the primary output we judge the AI tool on.

→ Format: numbered list, highest-impact action first
→ Each item: what to do + which campaign/creative + why (data signal)
→ Covers all four quadrants: pause, scale, fix, test
→ Written in plain English — no analyst jargon, no vague generalisations

EXAMPLE AI OUTPUT — DO THIS NEXT WEEK

"1. PAUSE — 'Growify|BOF|IN_Mumbai'. ROAS 0.8 for 18 days, no improvement. Save ₹8,000/week."

"2. SCALE — 'Influencer_Priya_Saree_TOF'. ROAS 4.2x. Increase daily budget from ₹2,000 to ₹5,000."

"3. FIX — UK London landing page. 4.1% CTR but 0.2% CVR means 95% of clicks are leaving. A/B test headline."

"4. TEST — Diaspora-UAE BOF retarget. TOF is working (ROAS 3.8). No BOF campaign exists for this segment. Launch."
